About Image Services Image Services are based on raster data. Raster data is essentially a grid of cells. Raster format is usually preferred over vector format to store continuous data such as rainfall or elevation because it can better represent granular variations in data over an area. Because the map images are created dynamically when the layer requests them, contents of map images can be customized by modifying some layer properties. Image Services are accessible on the web as SOAP and REST web services. You can find the URL of these web services on the. The data for an Image Service can be in any of the. The data can be published to an ArcGIS Server to create an Image Service. For more information about which capabilities are available for different inputs, see the topic. If the layer's spatial reference does not match the map's spatial reference, the layer will automatically re-project its map contents to match the map's spatial reference. For example, the ability to specify mosaic rules is only available if the data is stored as a. e828bfe731 [U He Diva Keygen Mac Photoshop](#)
